

Applying the Trig Ratios and Solving Triangles

When we calculate the measures of all the angles and all the lengths in a right triangle, we solve the triangle.

A. Methods of Solving Right Triangles

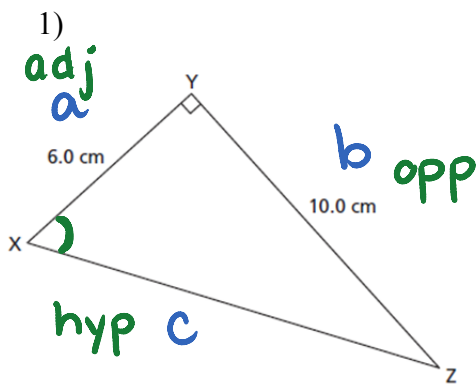

- Trigonometry **SOH CAH TOA**
- Pythagorean Theorem $a^2 + b^2 = c^2$
- Sum of Angles in a Triangle (180° Rule)

B. Solving a Right Triangle

Steps:

- 1) Sketch and label triangle.
- 2) Fill in known values.
- 3) Write a list of missing values.
- 4) Solve for missing side.
 - a) Trig for missing side.
 - b) Pythagoras for third side.
- 5) Solve for missing angle.
 - a) First angle always 90°.
 - b) 180° Rule for third angle.

Examples: Solve the following right triangles, sides to a tenth and angles to nearest degree.

XZ	11.7 cm
LX	59°
LZ	31°

$$\begin{aligned}
 XZ: \quad a^2 + b^2 &= c^2 \\
 6.0^2 + 10.0^2 &= c^2 \\
 36 + 100 &= c^2 \\
 136 &= c^2 \quad c = \sqrt{136} = 11.7 \text{ cm}
 \end{aligned}$$

$$\begin{aligned}
 LX: \quad \tan X &= \frac{10.0}{6.0} \quad X = \tan^{-1}\left(\frac{10.0}{6.0}\right) \\
 X &= 59^\circ
 \end{aligned}$$

$$LZ: \quad 180 - 90 - 59 = 31^\circ$$

2) In $\triangle ABC$, $\angle C = 90^\circ$, $BC = 5.4$ and $AC = 7.1$. Solve $\triangle ABC$.

$$\angle A: \tan A = \frac{5.4}{7.1}$$

$$A = \tan^{-1}\left(\frac{5.4}{7.1}\right) = 37^\circ$$

$$\angle B: 180 - 90 - 37 = 53^\circ$$

$$AB: a^2 + b^2 = c^2$$

$$7.1^2 + 5.4^2 = c^2$$

$$AB = 8.9$$

3)

$$\angle J = 180 - 90 - 39$$

GH	11.1 cm
HJ	14.3 cm
$\angle J$	51°

$$GH: \tan 39 = \frac{9.0}{x}$$

$$x = \frac{9.0}{\tan 39}$$

$$GH = x = 11.1 \text{ cm}$$

$$HJ: \sin 39 = \frac{9.0}{y}$$

$$HJ = y = 14.3 \text{ cm}$$
