

Lesson 5: Factor $x^2 + bx + c$

When we factor a trinomial the result is two binomials.

To factor $x^2 + bx + c$ we need to find two integers which have a **product** equal to c and **sum** to equal b .

Examples: Factor. Check by expanding

1) $x^2 + 8x + 12$

$$(x + 2)(x + 6) \text{ FOIL!}$$

$$= x^2 + 6x + 2x + 12 = x^2 + 8x + 12$$

2) $a^2 + 12a + 20$

$$(a + 10)(a + 2)$$

3) $x^2 - 13x + 12$

$$(x - 1)(x - 12)$$

$$= x^2 - 12x - x + 12$$

$$= x^2 - 13x + 12$$

4) $x^2 - 2x - 8$

$$(x + 2)(x - 4)$$

$$5) -15 - 2x + x^2 \Rightarrow x^2 - 2x - 15$$

$$\begin{array}{r} -15 \\ 3 \times -5 \\ -2 \end{array}$$

$$(x+3)(x-5)$$

$$\Rightarrow (3+x)(-5+x)$$

$$6) \frac{2x^2}{2} + \frac{14x}{2} + \frac{24}{2} = 2(x^2 + 7x + 12)$$

GCF=2

$$2(x+3)(x+4)$$

$$\begin{array}{r} 12 \\ 3 \times 4 \\ 7 \end{array}$$

$$7) \frac{-5y^2}{-5} + \frac{20y}{-5} + \frac{105}{-5} = -5(y^2 - 4y - 21)$$

GCF=-5

$$= -5(y+3)(y-7)$$

$$\begin{array}{r} -21 \\ 3 \times -7 \\ -4 \end{array}$$

Determining Integral Values of k

$$8) x^2 + kx + 18$$

$$\begin{array}{r} 18 \\ \times \\ +k \end{array}$$

<u>product</u>	<u>sum</u>
1 x 18	19
-1 x -18	-19
2 x 9	11
-2 x -9	-11
3 x 6	9
-3 x -6	-9

$$9) x^2 + 3x + k$$

$$\begin{array}{r} +k \\ \times \\ +3 \end{array}$$

<u>sum</u>
0 + 3
1 + 2
5 + (-2)

<u>product</u>
0
2
-10
